

- Column j_2 above Row i_2 is covered as follows:
 - A Dominance covers $(1, j_2)$ and $(2, j_2)$.
 - Another Dominance covers $(3, j_2)$ and $(4, j_2)$.
 - This process is continued until a Dominance covers $(i_2 - 2, j_2)$ and $(i_2 - 1, j_2)$.
- We have seen that $(j_2 - j_1) - 1$ is even.
 - A Dominance covers $(1, j_1 + 1)$ and $(1, j_1 + 2)$.
 - Another Dominance covers $(1, j_1 + 3)$ and $(1, j_1 + 4)$.
 - This process is continued until a Dominance covers $(1, j_2 - 2)$ and $(1, j_2 - 1)$.
- For each column i in the range $j_1 < i < j_2$, Dominances are used to cover the columns in the following manner:
 - A Dominance covers $(2, i)$ and $(3, i)$.
 - A Dominance covers $(4, i)$ and $(5, i)$.
 - A Dominance covers $(6, i)$ and $(7, i)$.
- For each column i in the range $j_1 < i < j_2$ or $j_2 < i < j_1$, Dominances are used to cover the columns in the following manner:
 - A Dominance covers $(1, i)$ and $(2, i)$.
 - A Dominance covers $(3, i)$ and $(4, i)$.
 - A Dominance covers $(5, i)$ and $(6, i)$.
 - A Dominance covers $(7, i)$ and $(8, i)$.

- Now let $j_1 = j_2$. Taking into consideration the way the squares are colored, $(j_2 - j_1) - 1$ is even.
- WLOG, let $i_1 < i_2$. The column j_1 above the Row i_1 is covered as follows:
 - A dominance covers $(1, j_1)$ and $(2, j_1)$.
 - A dominance covers $(3, j_1)$ and $(4, j_1)$.
 - This process is continued until a Dominance covers $(i_1 - 2, j_1)$ and $(i_1 - 1, j_1)$.
- The column j_1 below the Row i_2 is covered as follows:
 - A dominance covers $(i_2 + 1, j_1)$ and $(i_2 + 2, j_1)$.
 - A dominance covers $(i_2 + 3, j_1)$ and $(i_2 + 4, j_1)$.
 - This process is continued until a Dominance covers $(7, j_1)$ and $(8, j_1)$.
- The column j_1 in between Row i_1 and Row i_2 is covered as follows:
