

- For each column j_1 where $j_1 < i < j_2$, Dominos are used to cover the columns as follows:
 - A Domino covers $(2, j_1)$ and $(3, j_1)$. A Domino covers $(4, j_1)$ and $(5, j_1)$. A Domino covers $(6, j_1)$ and $(7, j_1)$.
- For each column i where $1 < i < j_1$ or $j_2 < i < 8$, Dominos are covered as follows:
 - A Domino covers $(1, i)$ and $(2, i)$. A Domino covers $(3, i)$ and $(4, i)$. A Domino covers $(5, i)$ and $(6, i)$. A Domino covers $(7, i)$ and $(8, i)$. $\square$
- Now, let both i_1 and i_2 be odd.
 - $\therefore 8 - i_1 = 2 \times 4 - 2y - 1 = 2(4 - y - 1) + 1$. By Defn. 1, $(8 - i_1)$ is odd.
 - $\therefore 8 - i_2 = 2 \times 4 - 2(x + y) - 1 = 2(4 - x - y - 1) + 1$. By Defn. 1, $(8 - i_2)$ is odd.
- Column j_1 below Row i_1 is covered as follows:
 - A Domino covers $(i_1 + 1, j_1)$ and $(i_1 + 2, j_1)$.
 - Another Domino covers $(i_1 + 3, j_1)$ and $(i_1 + 4, j_1)$.
 - This process is continued until a Domino covers $(6, j_1)$ and $(7, j_1)$.
- Column j_2 below Row i_2 is covered as follows:
 - A Domino covers $(i_2 + 1, j_2)$ and $(i_2 + 2, j_2)$.
 - Another Domino covers $(i_2 + 3, j_2)$ and $(i_2 + 4, j_2)$.
 - This process is continued until a Domino covers $(6, j_2)$ and $(7, j_2)$.
- We have seen that $(j_2 - j_1) + 1$ must be even.
 - Domino covers Row 8, Column j_1 and Row 8, Column $j_1 + 1$.
 - Another Domino covers Row 8, Column $j_1 + 2$ and Row 8, Column $j_1 + 3$.
 - This process is continued until a Domino covers Row 8, Column $j_2 - 1$ and Row 8, Column j_2 .
- $(i_1 - 1) = 2y + 1 - 1 = 2y$. By Defn. 1, $(i_1 - 1)$ is even.
 - $(i_2 - 1) = 2(x + y) + 1 - 1 = 2(x + y)$. By Defn. 1, $(i_2 - 1)$ is even.
- Column j_1 above Row i_1 is covered as follows:
 - A Domino covers $(1, j_1)$ and $(2, j_1)$.
 - Another Domino covers $(3, j_1)$ and $(4, j_1)$.
 - This process is continued until a Domino covers $(i_1 - 2, j_1)$ and $(i_1 - 1, j_1)$.
